## HW2

### Task 1 Screenshot of invoking the figlet function:

#### Task 2 Complete slack-request/handler.py

The completed slack-request/handler.py file will be updated to Github Repository.

#### Task 3 Complete slack-interactive/handler.py

The completed slack-interactive/handler.py file will be updated to Github Repository.

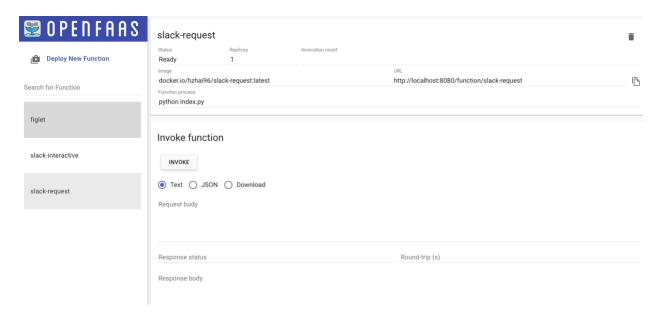

#### Task 4 Screenshot of running the command:

sudo journalctl -u faasd --lines 40

```

#### **Question 1 What is the command to invoke the slack-request function:**

a. Via Curl

curl -d "http://127.0.0.1:8080/function/slack-request

b. Via faas-cli

faas-cli invoke slack-request

#### Question 2 What is the output when invoke slack-request function:

The output is the json object in string format that defined in slack-request/handle.py file.

#### Question 3 What is the command to invoke the slack-interactive function:

a. Via Curl

curl -d '{"message": "Hello, world!"}' <a href="http://127.0.0.1:8080/function/slack-interactive">http://127.0.0.1:8080/function/slack-interactive</a>

c. Via faas-cli

faas-cli invoke slack-interactive

Then input a json string: '{"message": "hello"}'

#### Question 4 What is the output when invoke slack-request function:

The output is the json object in string format that defined in slack-interactive/handle.py file.

#### Question 5 How to pass different argument to functions?

When using curl, the argument can be passed by adding "-d" option and '<argument>'.

When using faas-cli, the argument can be passed when invoking the function. After using command "faas-cli invoke slack-interactive", it will read from STDIN, now we can type in the argument and pass it to the function.

# Question 6 How would you change the slack-interactive function to react to different inputs?

A simple way is to add an if statement to check if the json passed to function's value, and then return the json object string. In the homework, the interactive function is modified to check if the input argument's 'message' is equal to 'request'. If so, the function will return the json string. The modified interactive function:

```
port urllib
def handle(req):
          urlstring = urllib.unquote(req).decode('utf8').strip('payload=')
           in Ist ing = di lilio.inquote(eq).or
response = json.loads(urlstring)
if response['message'] == 'reques
data = {
